Abstract

A process is disclosed for evaluating data obtained from textile fabrics. In order to devise a process which allows data obtained from textile fabrics to be easily compared, assessed in a differentiated manner as to their significance and evaluated, the data are determined in a section (3a, 3b) of the surface of the fabric, sorted according to at least two parameters (13, 14) and represented in an image (12, 13) as a function of the parameters.
